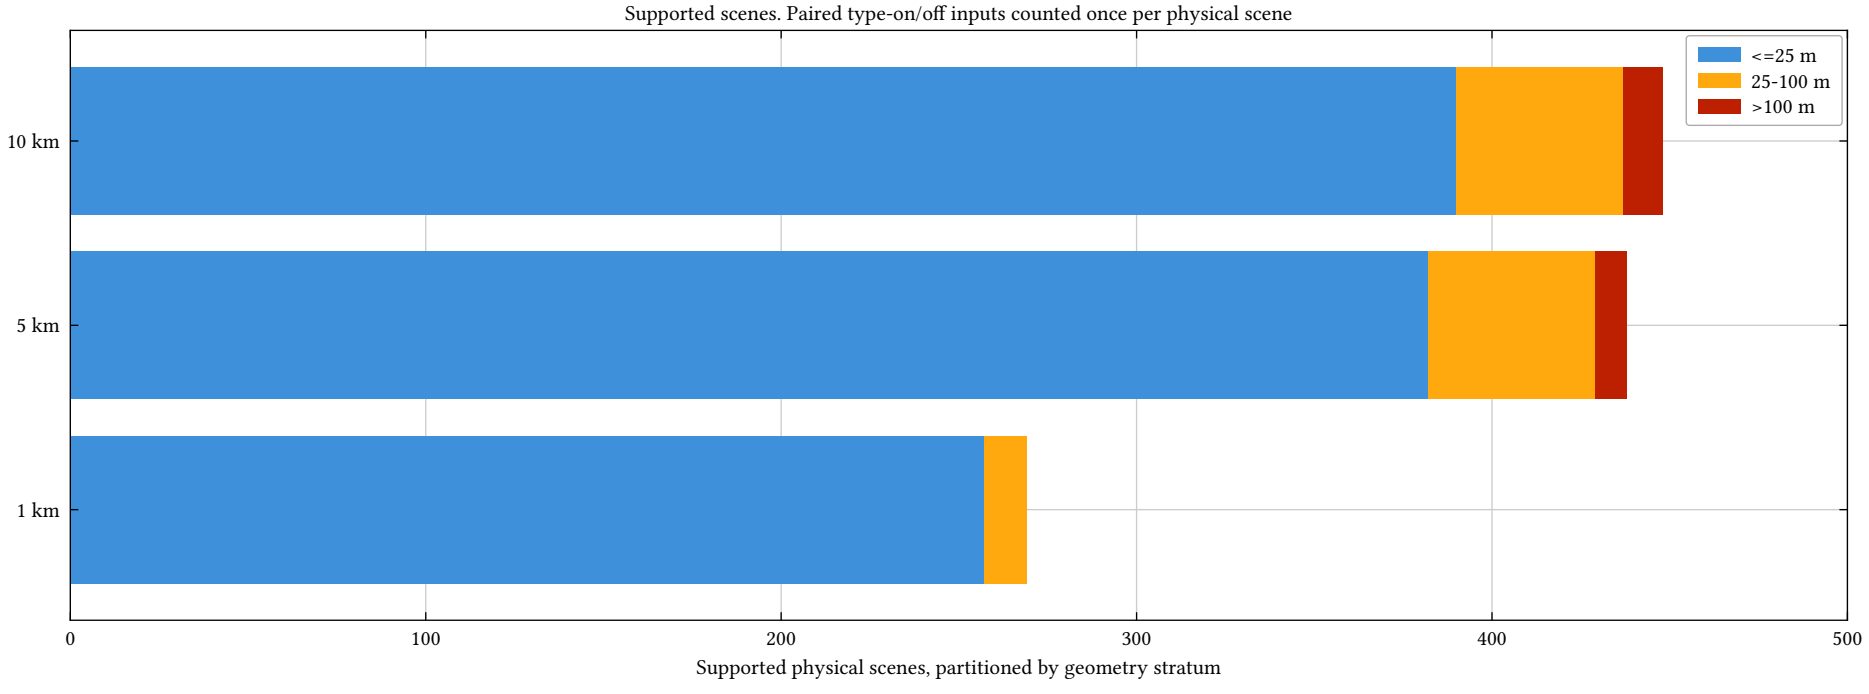
Development known-association geometry

Supported physical scenes by range and 95% ellipse major-radius stratum. Snapshot dated 2026-10-26.



Range	Supported / 600	<=25 m	25-100 m	>100 m	Singular	Median matched features
1 km	269	257	12	0	0	7
5 km	438	382	47	9	0	26
10 km	448	390	47	11	0	29

Geometry uses known associations and bearing Fisher information, with a 0.5 deg sigma fallback and 0.05 deg floor. The 95% major radius is singular when geometry is not full rank. Support requires valid reference water and at least three detected postmerge catalog-matched physical groups. Each range has 600 paired type-on/off rows from the same physical scenes; geometry, support, strata, and medians match exactly, so plotted counts use one physical set rather than adding pairs as independent scenes.

Descriptive development geometry only. These known-association diagnostics are not search outcomes or localization accuracy. Held-out rows and search outputs were not read.
