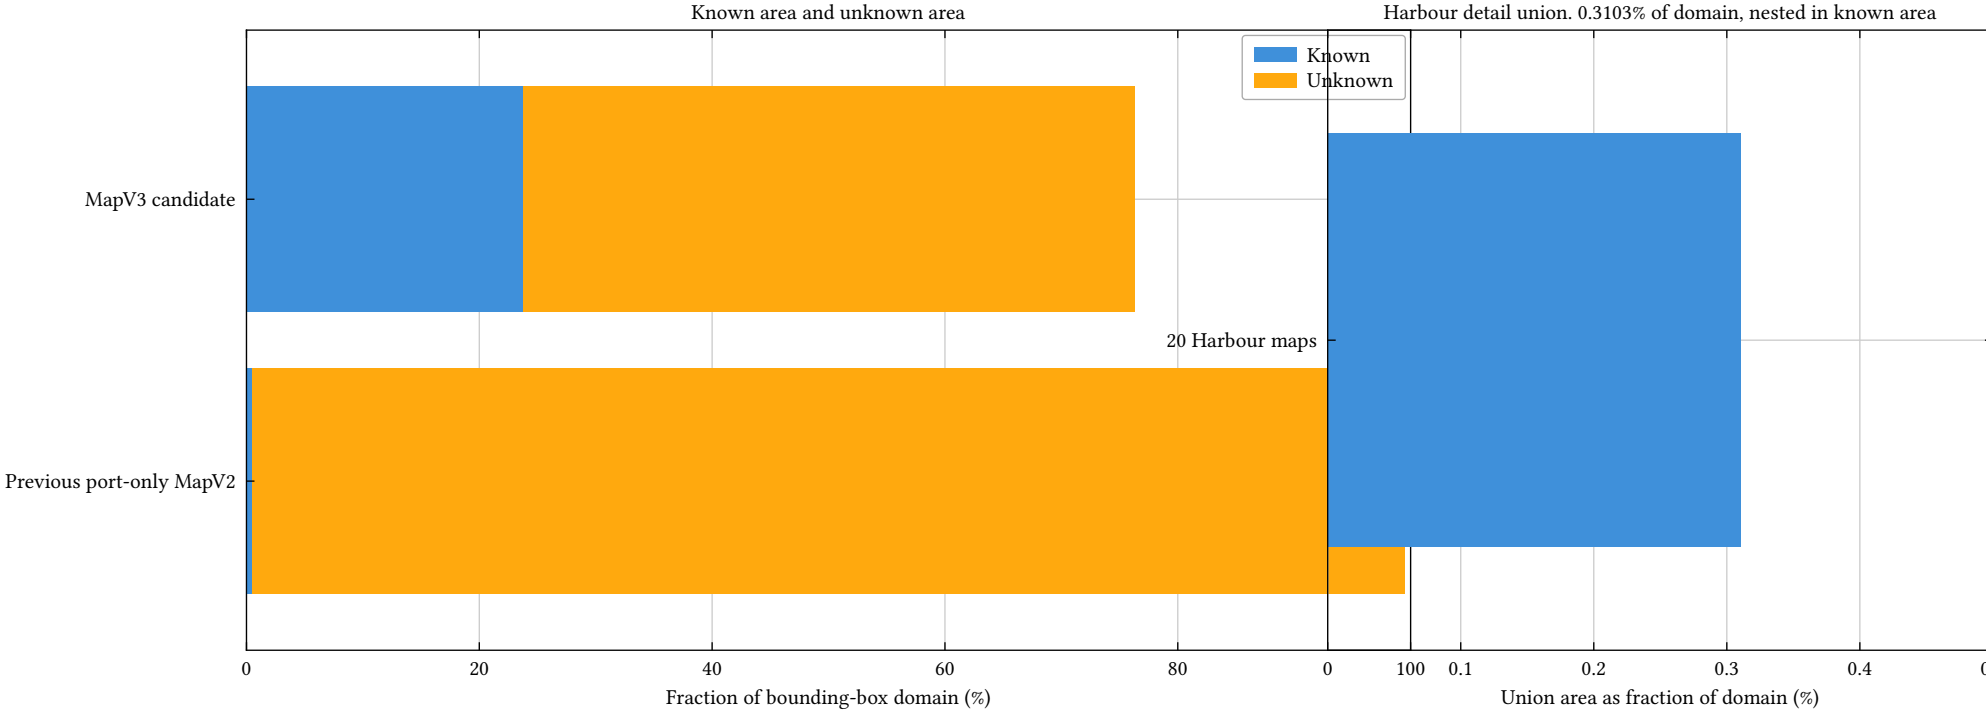
Chart-derived coverage and port detail

Equal-area comparison over the same Eastern Seaboard bounding box. Snapshot dated 2026-10-26.



The previous MapV2 has 0.482% known port-only area and 99.518% unknown. The MapV3 candidate has 76.260% known bbox area and 23.740% unknown over a 3,383,691.331 km² domain. Unknown remains explicitly unknown. The 20-map Harbour union covers 10,500.268 km², or 0.3103% of the domain, wholly within coarse known coverage; it is overlaid detail and does not add to the known-area total. All 24 port maps were byte-verified. No Approach or Berthing maps contribute fine detail.

The validated MapV3 candidate is approved as a new versioned benchmark input; the existing default remains MapV2. Coverage is chart-derived and partial; the map does not establish navigable depth, current shoreline conditions, or field accuracy.
