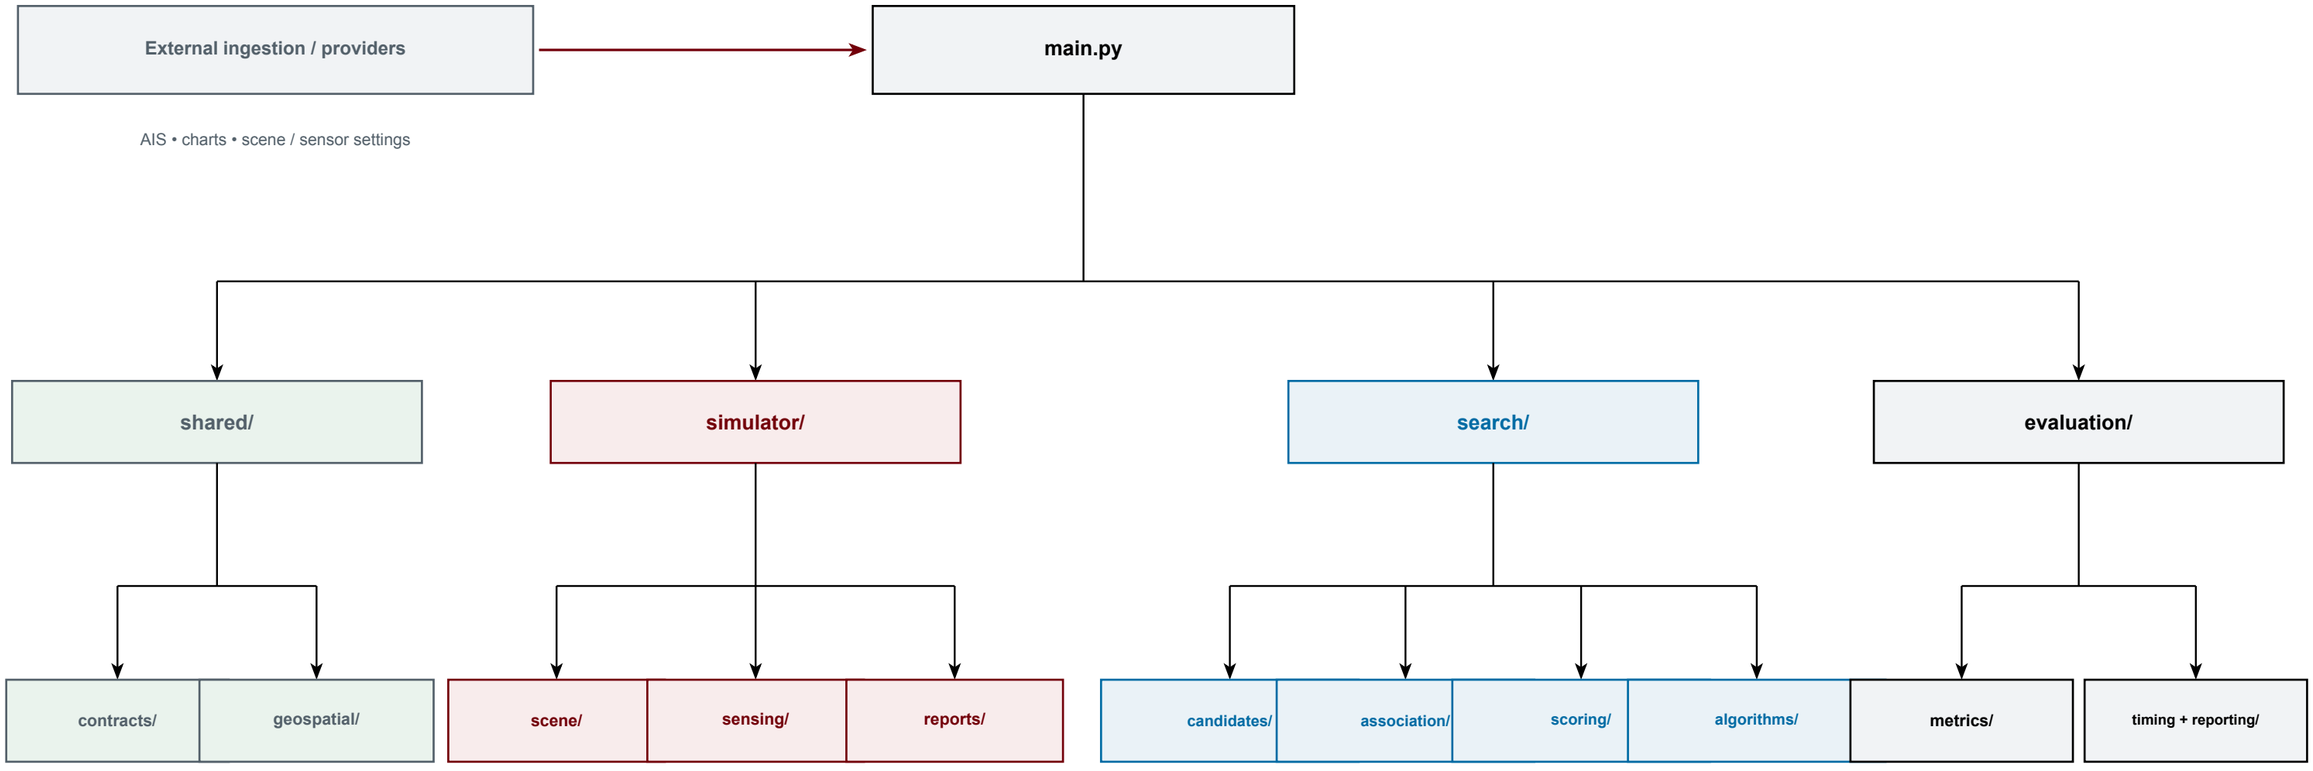
Software package tree

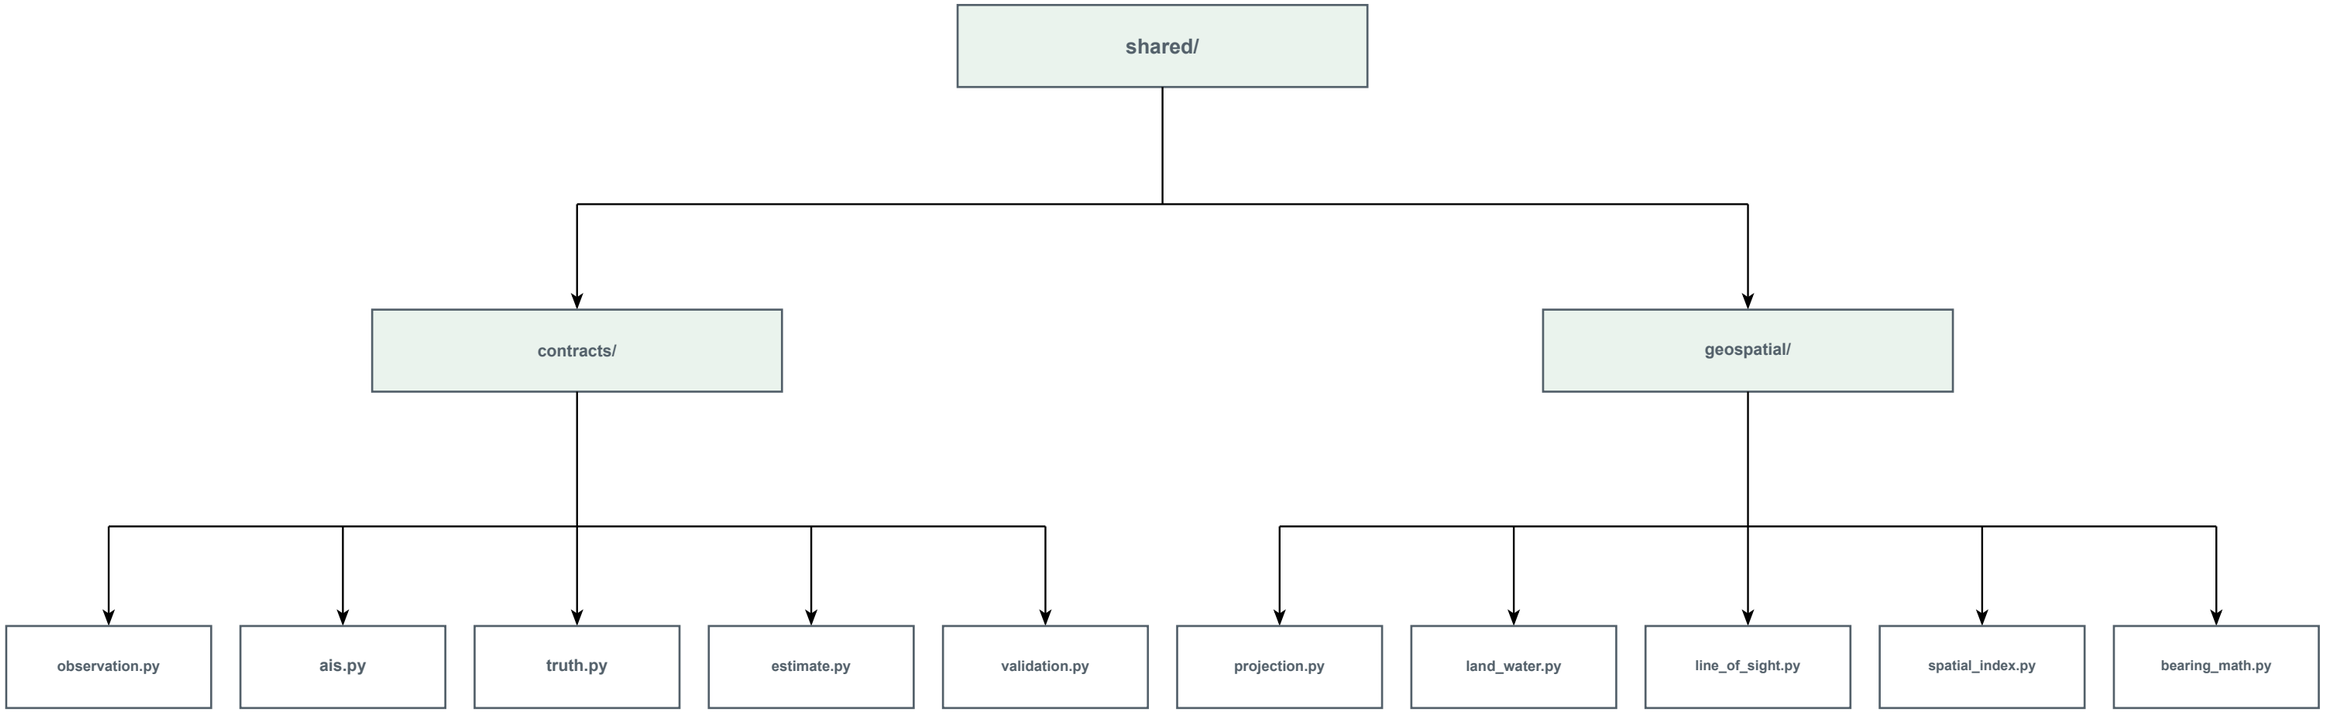
Boxes are software modules. External ingestion is outside the package; every package node connects to its parent.



No simulator ↔ search imports. Both may call shared/ contracts and geospatial APIs.

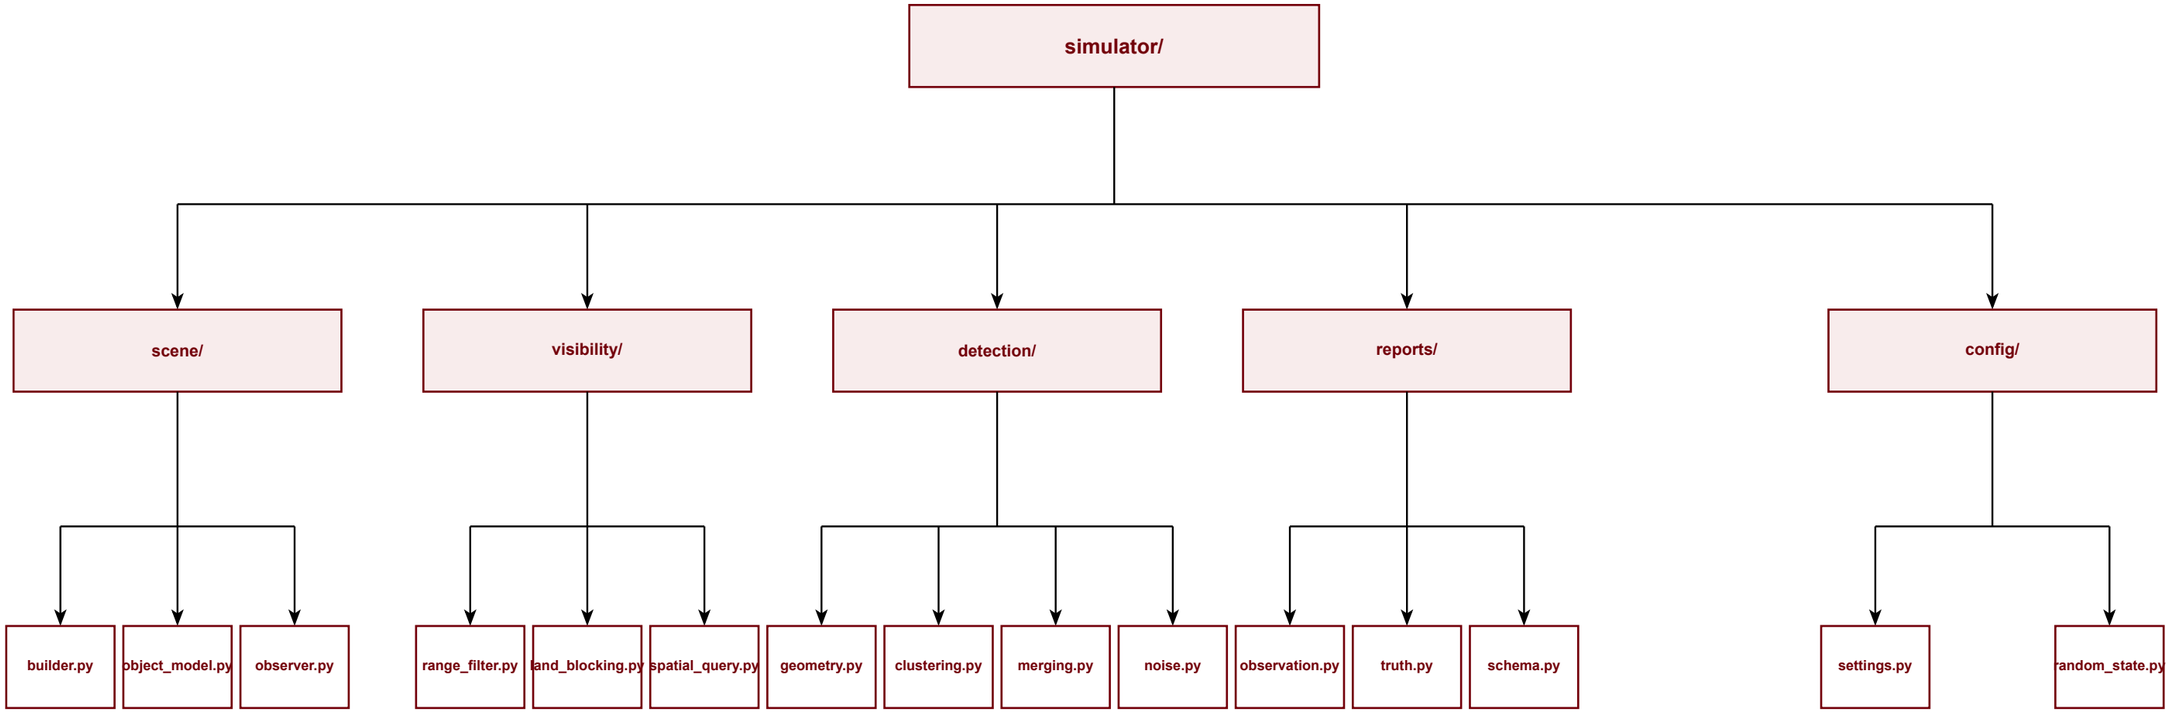
shared/ expanded

Neutral contracts and geometry. This branch is the only reusable software dependency between simulator and search.



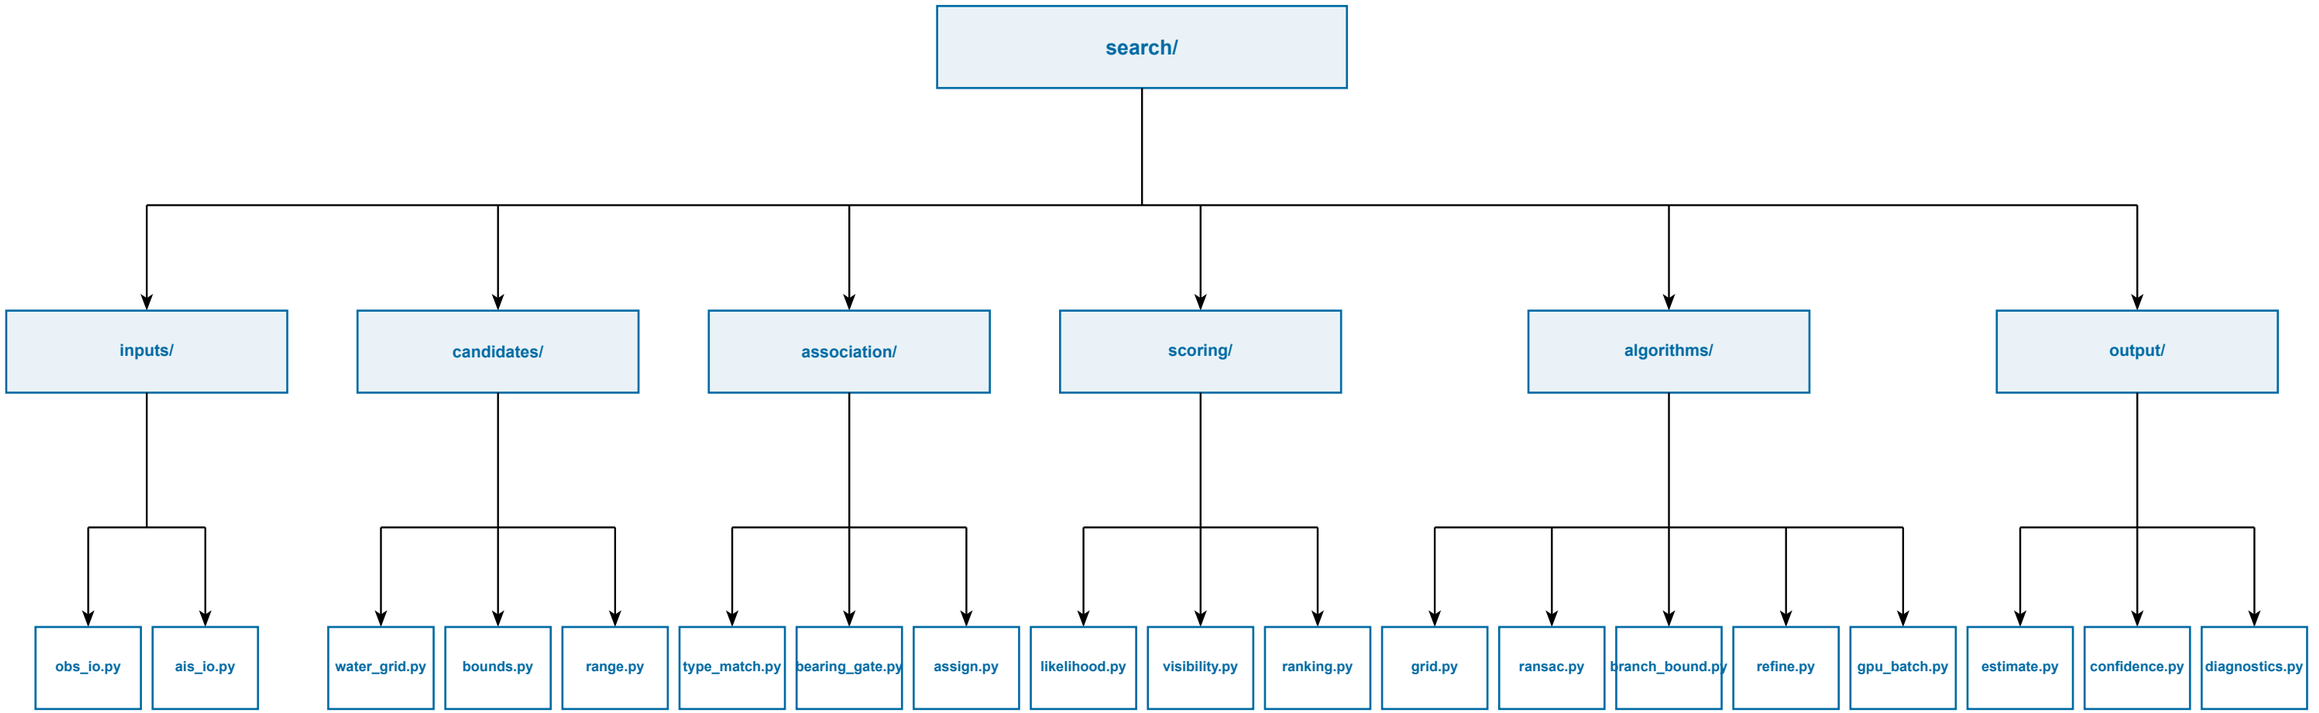
simulator/ expanded

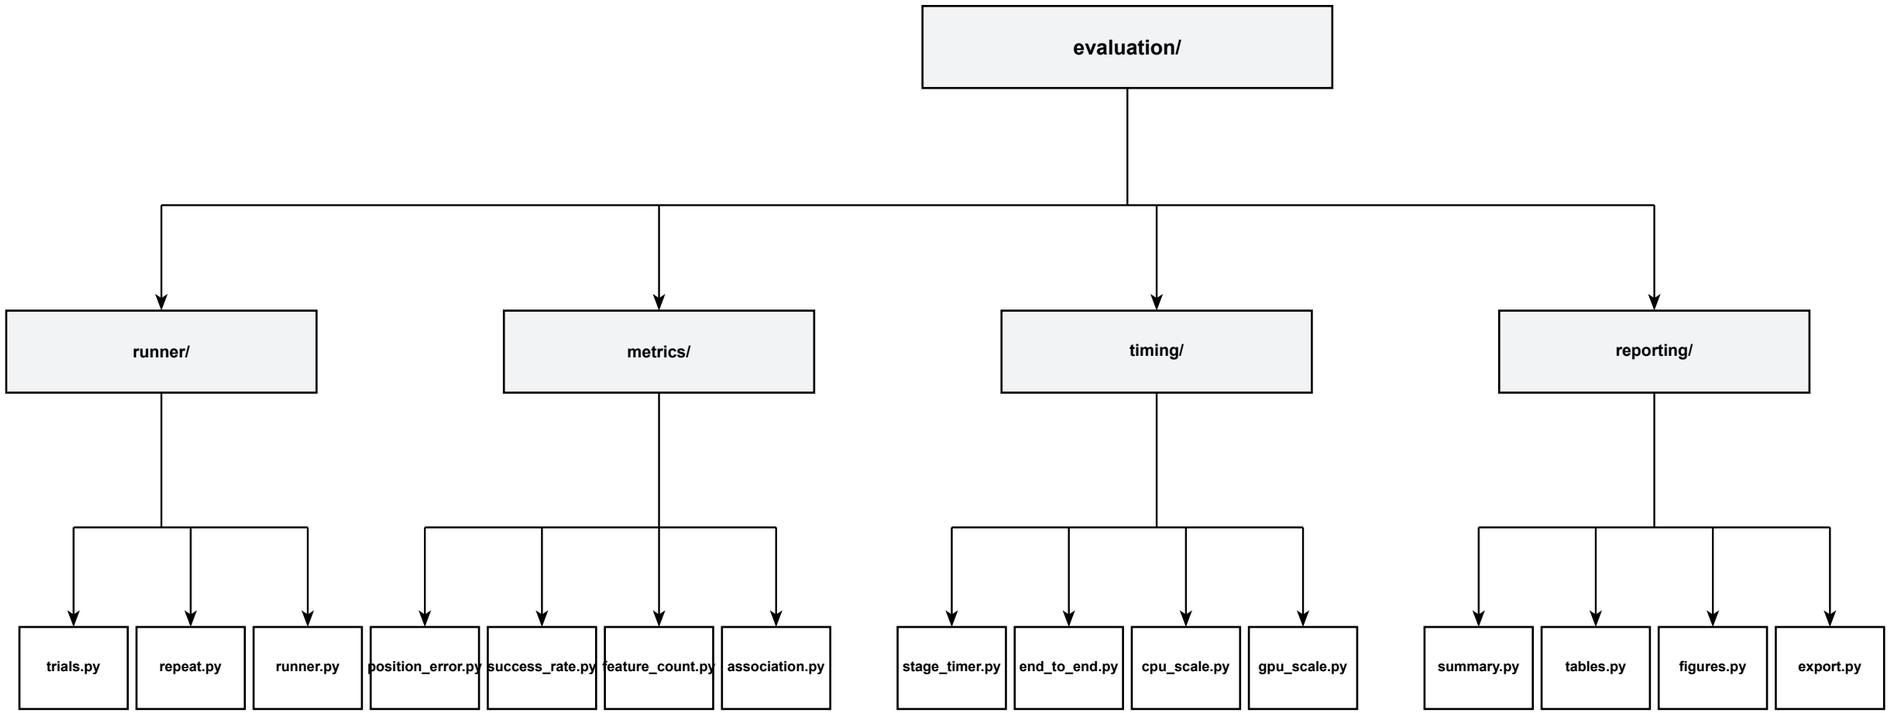
Scene construction, range and land visibility, angular detection, and separate measurement / truth reports.



search/ expanded

Candidate generation, object association, scoring, and swappable search algorithms. All feature nodes are separate and connected to their parent.



evaluation/ expanded


The evaluator receives estimated pose and simulator truth, and reports localization accuracy, feature requirements, and runtime.
