Cached refinement and single-addition expansion diagnostic

Development diagnostic. 64 modes were score-selected from an incomplete partial-cache run. Snapshot dated 2026-10-26.

The stage score winner moved from 853.002 km to 11.127 m. The last result ranks first among 64 composite-audited selected modes. The source search remains incomplete.

Actual minimum-score estimate at each stage Each point is the minimum-objective returned estimate for that stage; the winning mode can change between stages. The vertical axis is logarithmic so the 11.127 m expansion result remains legible beside the earlier 853 km results. Error uses evaluator truth after each estimate was produced.

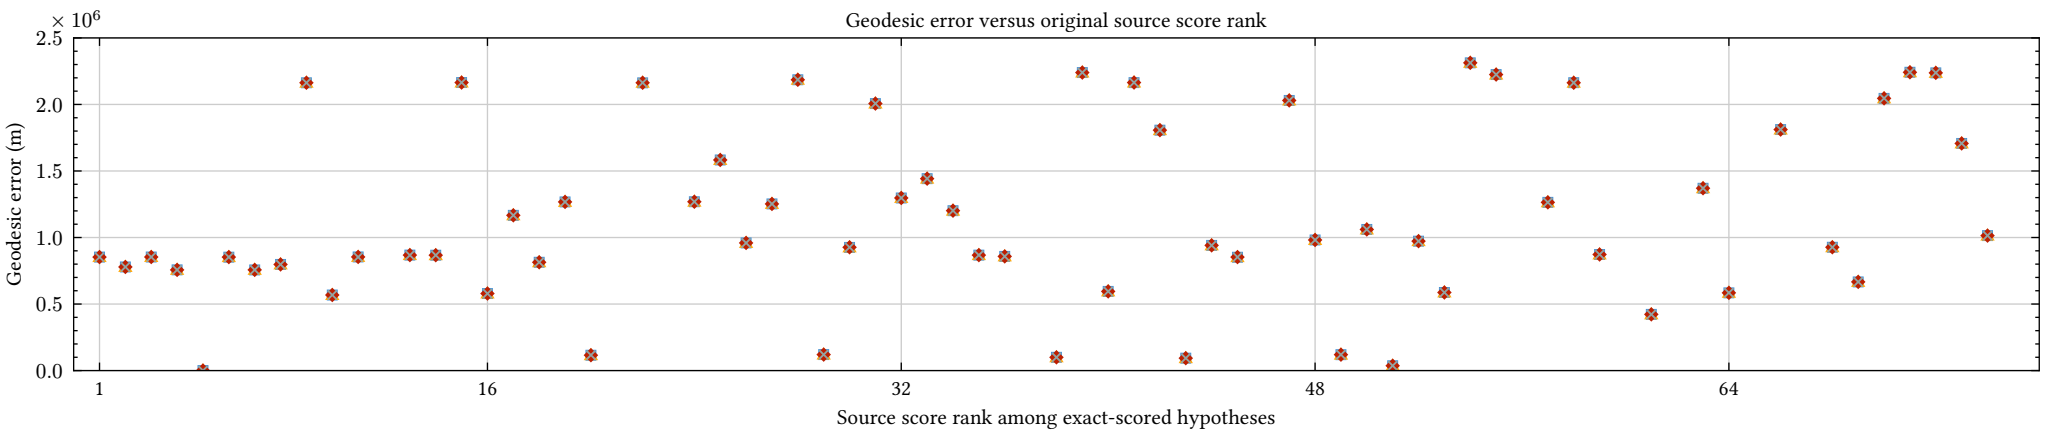

Single-addition leader. Local error progression for the same selected mode. This was the lowest-error selected alternative before expansion. The audited branch replay moved from 296.286 m to 266.378 m, then to 181.279 m, and finally to 11.127 m after adding the fifth assignment. It ranks 1 of 64 composite-audited selected modes by expansion objective.

Stage result	Mode index	Source rank	Score	Error (m)	Correct assignments	Stage score rank
Cached exact source	0	1	14.605335	853001.682	0 / 3	1 / 64
Pattern refinement	2	3	10.324237	853439.78	0 / 4	1 / 64
Assigned fit	2	3	10.324237	853439.78	0 / 4	1 / 64
Single-addition expansion	4	5	5.026904	11.127	5 / 5	1 / 64
Prior wrong mode after expansion	2	3	10.324237	853439.78	0 / 4	2 / 64

Errors across the selected subset The first three marker series include all 64 score-selected modes. The single-addition series includes 64 composite-audited selected mode rows; ranks are within this fixed selected set.

Series order. Square is cached source, triangle is pattern refinement, diamond is assigned fit, and cross is single-addition expansion. No legend box is used.

The assigned-fit diagnostic used 57.6525 s for 64 modes and 128 starts. The serial expansion run stopped at 60/64 on its deadline; the parallel run stopped at 63/64 after disk interruption at 568.419 s. The composite audit reconciles per-mode evidence for 64/64 selected modes, but is not a completed parallel run or a combined latency result. Of 22,000 selected-population branch results, 12,150 exact-score replays were reused from the serial audit, 510 new results were exact-scored and replayed from the parallel run, 9,334 invalid-water outcomes and 6 max_nfev outcomes were structurally retained. The source search left 47182 hypotheses exact-scored, 82 unresolved, and 1410282 unknown at interruption. Composite audit SHA-256: 080b61e160a18c60657bfc7e4394b0c57df742a597f841ab484045e96cd62917. Previous serial audit SHA-256: 7111b39f72caf0df53e655681cb4460118b781a08bbbafdd396056774523bbf8. The selected-mode audit has no accepted-fix claim or certificate; full-domain completion is false.
