Cached refinement and single-addition expansion diagnostic

Development diagnostic. 64 modes were score-selected from an incomplete partial-cache run. Snapshot dated 2026-10-26.

The stage score winner moved from 853.002 km to 11.127 m. The last result leads the 60 completed modes; four remain pending, so the selected set is incomplete.

Actual minimum-score estimate at each stage Each point is the minimum-objective returned estimate for that stage; the winning mode can change between stages. The vertical axis is logarithmic so the 11.127 m expansion result remains legible beside the earlier 853 km results. Error uses evaluator truth after each estimate was produced.

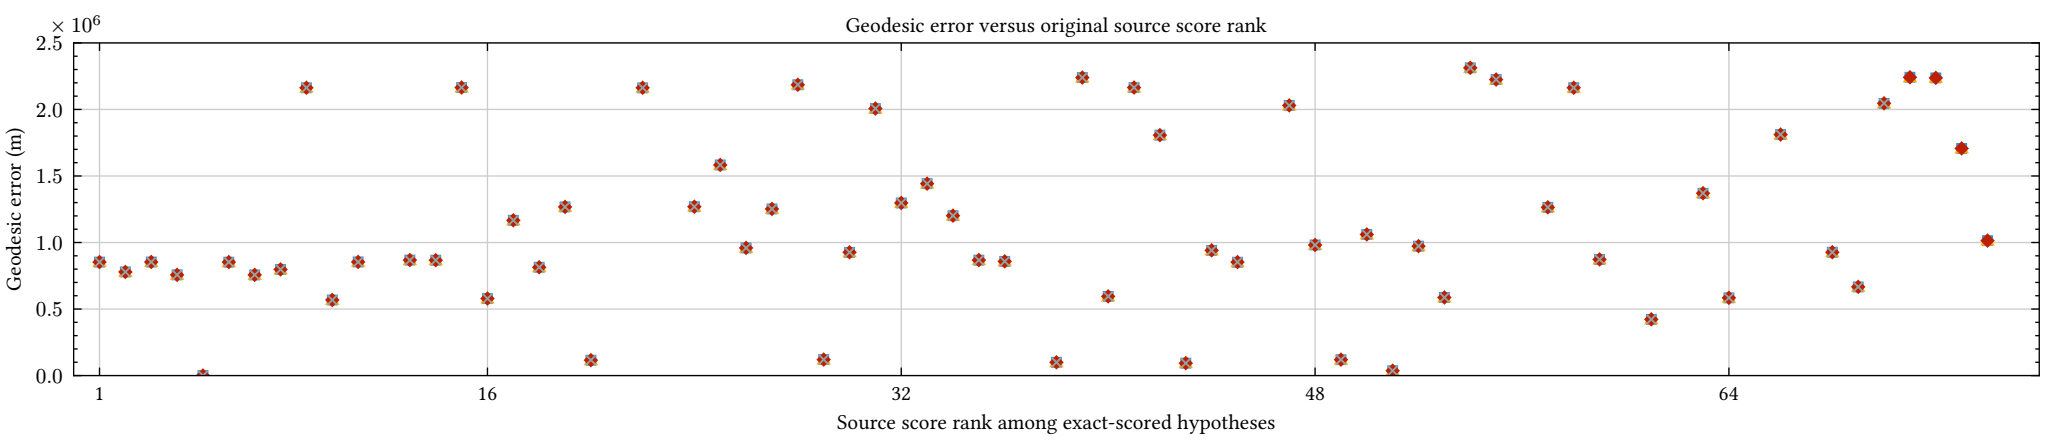

Single-addition leader. Local error progression for the same selected mode. This was the lowest-error selected alternative before expansion. The audited branch replay moved from 296.286 m to 266.378 m, then to 181.279 m, and finally to 11.127 m after adding the fifth assignment. It ranks 1 of 60 completed modes by expansion objective, with four modes pending.

Stage result	Mode index	Source rank	Score	Error (m)	Correct assignments	Stage score rank
Cached exact source	0	1	14.605335	853001.682	0 / 3	1 / 64
Pattern refinement	2	3	10.324237	853439.78	0 / 4	1 / 64
Assigned fit	2	3	10.324237	853439.78	0 / 4	1 / 64
Single-addition expansion	4	5	5.026904	11.127	5 / 5	1 / 60
Prior wrong mode after expansion	2	3	10.324237	853439.78	0 / 4	2 / 60

Errors across the selected subset The first three marker series include all 64 score-selected modes. The single-addition series includes 60 completed mode rows. Four modes remain pending; expansion ranks are within the completed subset only.

Series order. Square is cached source, triangle is pattern refinement, diamond is assigned fit, and cross is single-addition expansion. No legend box is used.

The assigned-fit diagnostic used 57.6525 s for 64 modes and 128 starts. The single-addition pass took 1800.016071 s serially, covering 60 of 64 modes; four are pending and full branch-result replay is independently audited for this completed prefix. These are independent stage diagnostics, not end-to-end or per-frame latency. The source search left 47182 hypotheses exact-scored, 82 unresolved, and 1410282 in an unknown state at interruption. Cached-refinement evaluator SHA-256: 88290e7ac580c0cd7bd32fb7fd813e0ff7e55ac3a7aefbcca5ee295f0a0a79cd. Assigned-fit evaluator SHA-256: e0c1b989f82b7a29e3a09dfde541ed0f437edcc82a4a15ab162fd8e01422d3a8. Assignment-expansion full-audit evaluator SHA-256: 7111b39f72caf0df53e655681cb4460118b781a08bbbafdd396056774523bbf8. The frozen audit has 20,435 branch results in total. Modes 0–59 account for 20,381 fully replayed results: 12,150 exact-scored poses, 8,225 invalid-water outcomes, and 6 max_nfev outcomes without an exact score. Partial mode 60 adds 54 scored results that were structurally checked only, not replayed. Four selected modes remain pending; the run is interrupted, with no accepted-fix claim, no certificate scope, and no full-domain completion. The preceding provisional artifact SHA-256 is b7e3541a77a86943e5553f449769cdc12329696a3c3b96cf69d4199e54f279a5. Authorship J.C. Vaught.
