Every valid explanation in the cell must remain a possible edge.

Certified failure rejects. Unsupported bounds retain.

Whole cell is known land

$$C \subseteq L_{\text{known}}$$

One report has no object

$$\exists i : \deg_C(i) = 0$$

Too few distinct possibilities

$$n_C < 64$$

No simultaneous injection

$$\nu(E_C) < 64$$

Whole-cell tests use positive reports. Unseen objects are not penalties.
