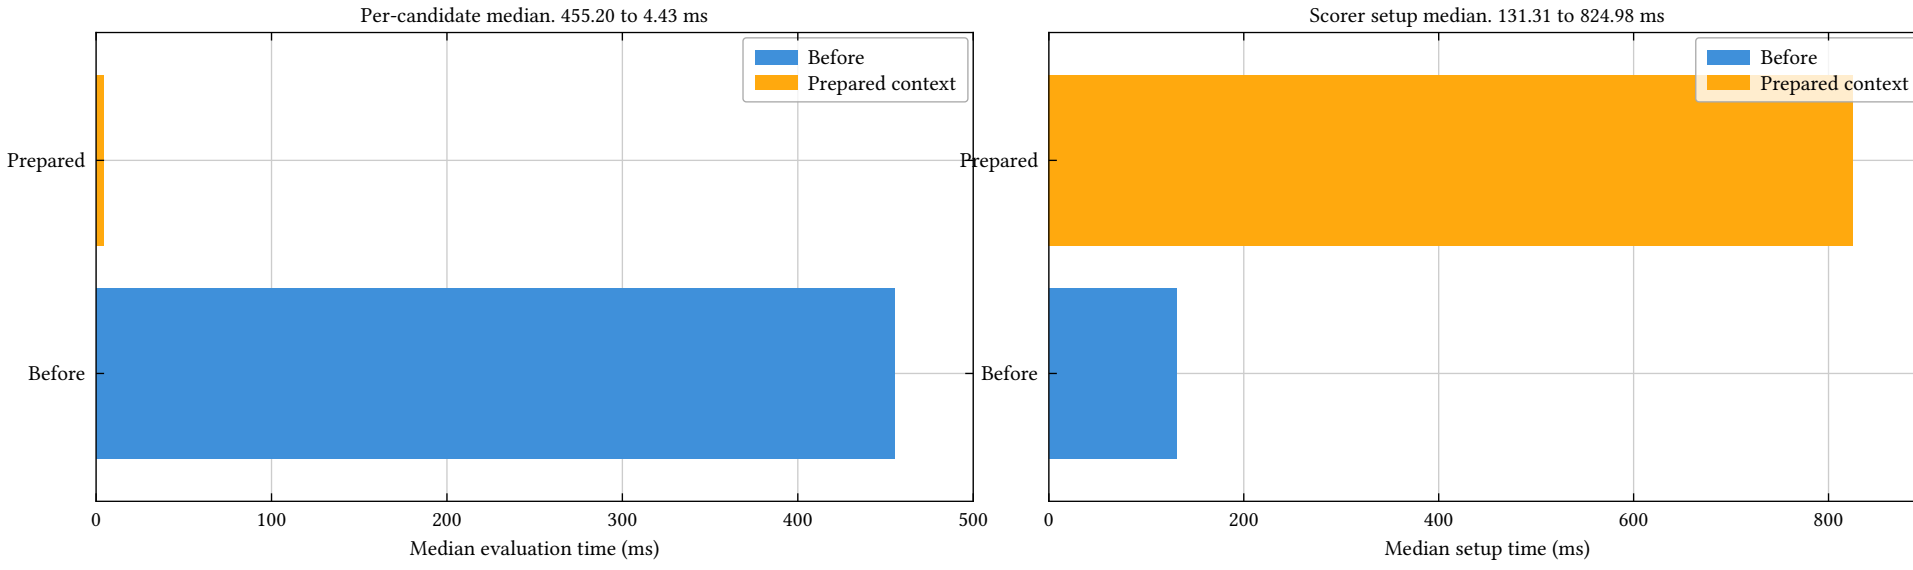
Candidate-independent preparation diagnostic

Fixed-candidate CPU profile dated 2026-10-26



Fixed candidate	Before score	Prepared score	Predicted groups
1	24.544416125800623	24.544416125800623	0
2	31.45217140478276	31.45217140478276	3
3	26.02598193152521	26.02598193152521	4

The same three fixed projected positions, 66,668-record catalog, and four-report development measurement set were evaluated in both runs. Candidate outputs matched exactly, including scores and predicted group counts. The plotted values are medians across four scorer setups and twelve candidate calls in each diagnostic run. Preparation moved repeated catalog work into scorer initialization, increasing setup time while reducing candidate-call time. These observations are diagnostic rather than controlled latency measurements and do not measure accuracy, held-out performance, calibration, or GPU scaling.
