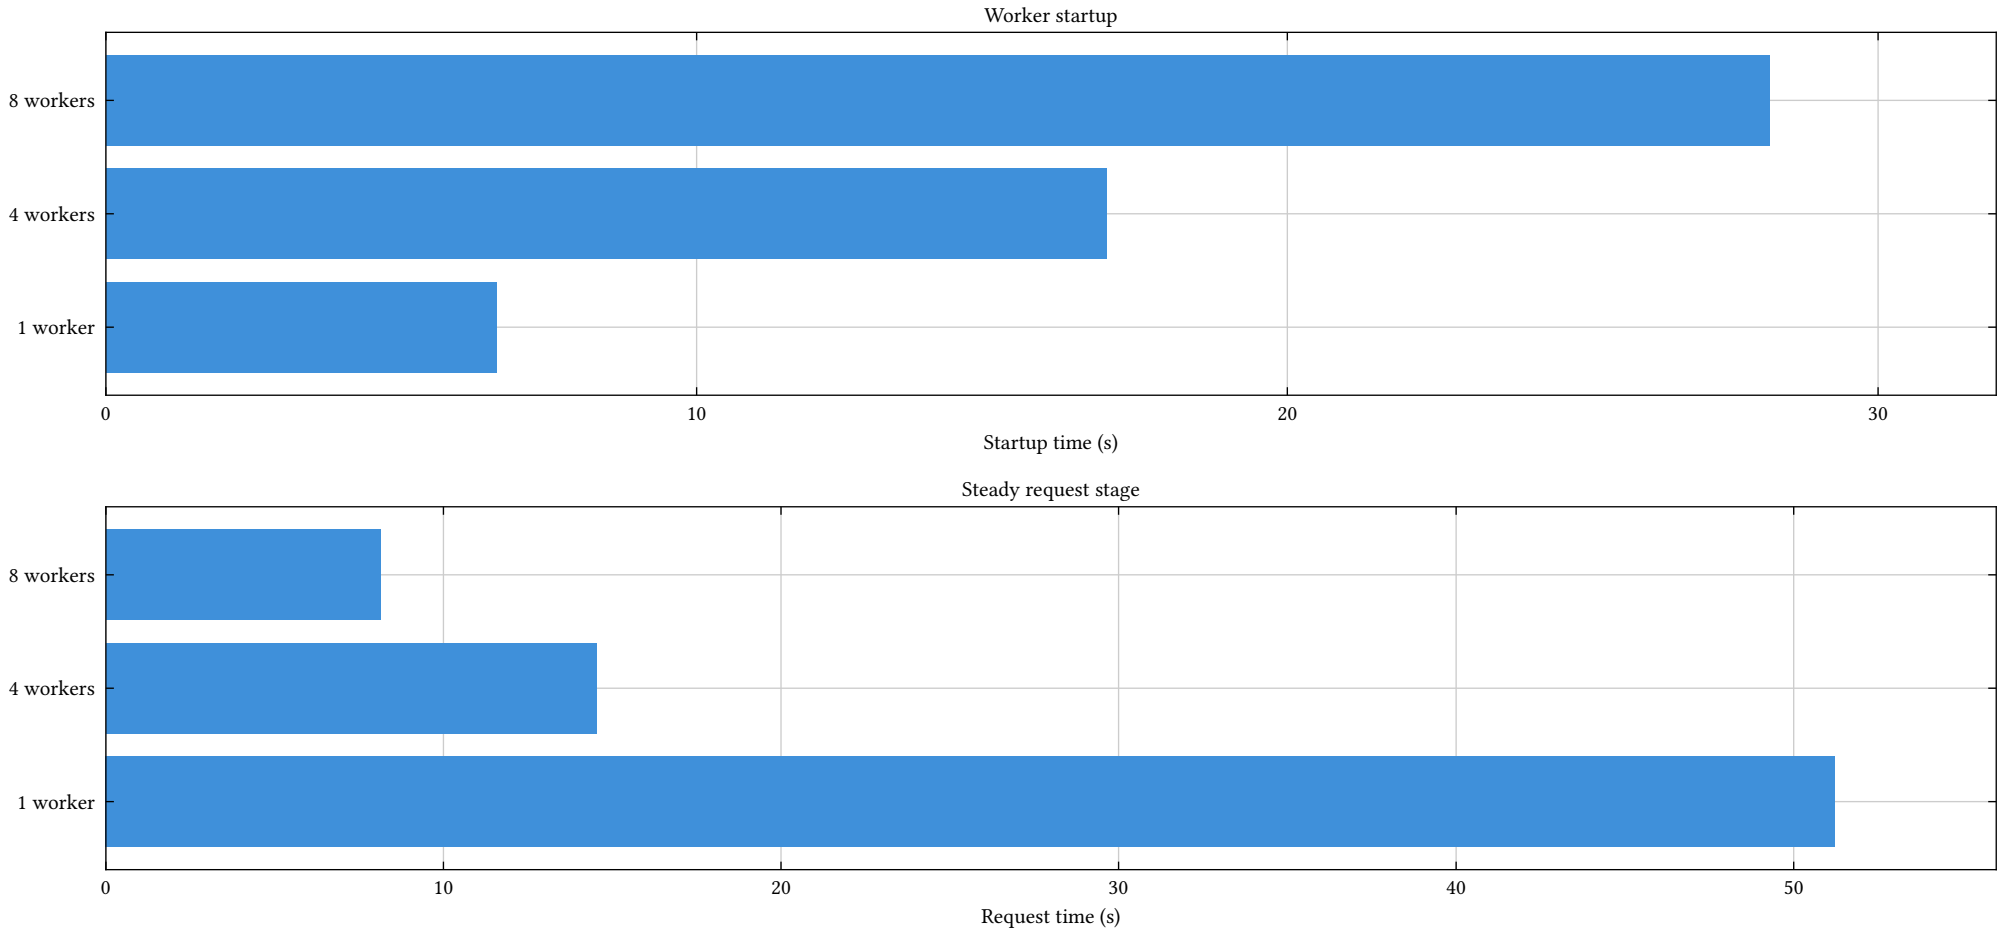
Cached candidate scoring progress

Exact scoring profiles on shared-host cache samples. Captured 2026-10-26.

Diagnostic measurements only. No full-domain localization success or full-coast accuracy result.

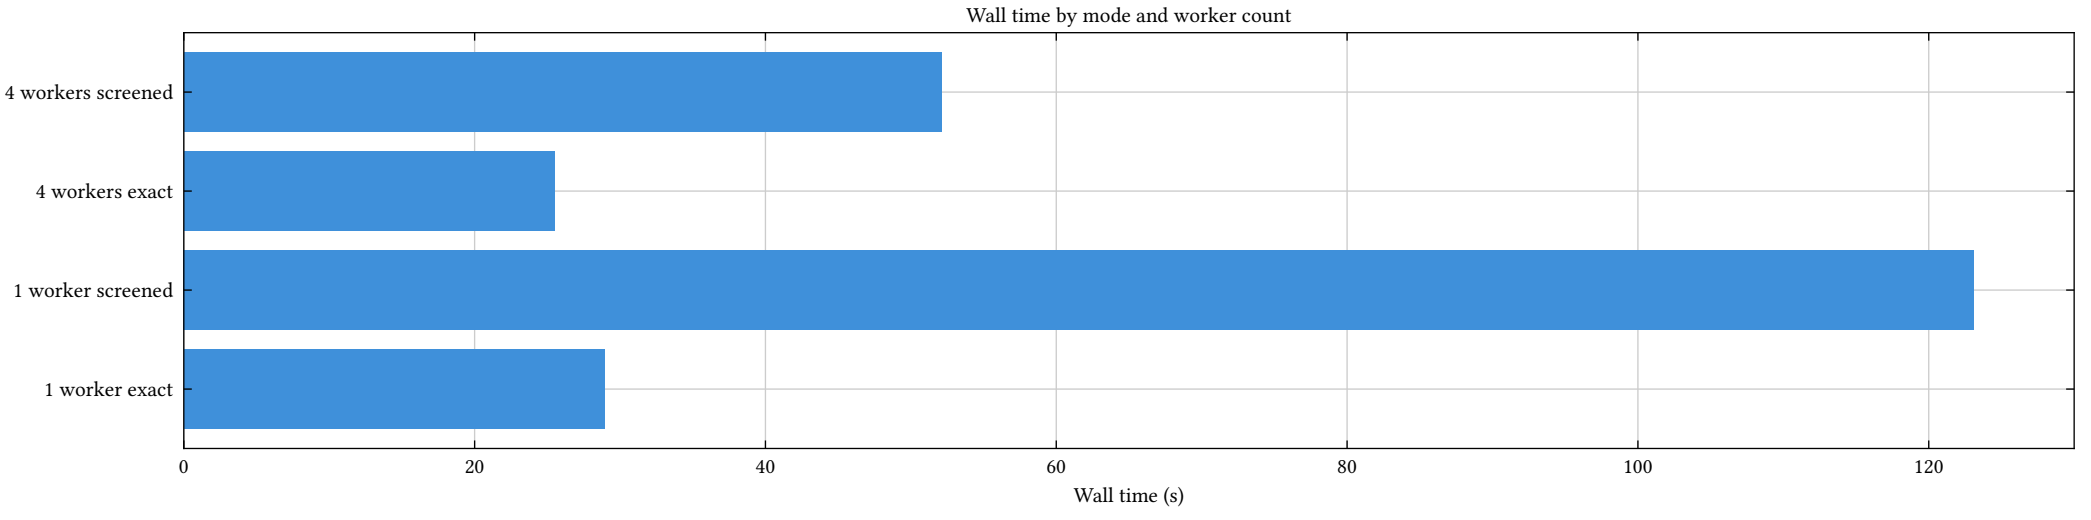
2,048-candidate exact sample Startup and steady request stages are shown separately. All completed runs evaluated the same 2,048 selected candidates.



Workers	Startup (s)	Request (s)	Candidates	Exact scored	Best objective	Best candidate ID
1	6.613	51.227	2048	992	24.12709	cell:-35:2251
4	16.945	14.530	2048	992	24.12709	cell:-35:2251
8	28.157	8.136	2048	992	24.12709	cell:-35:2251

The 1, 4, and 8 worker exact runs share best objective 24.12709 and tie ID cell:-35:2251. The 16-worker run timed out during worker startup after 53.073 s and dispatched 0 candidates.

Initial 255-candidate exact versus screened sample Wall time for the fixed initial cache-order sample. Exact mode evaluates all candidates; screened mode may prune candidates.



Run	Wall time (s)	Exact scored	Pruned	Best candidate ID
1 worker exact	28.934	131	0	cell:74:2578
1 worker screened	123.106	49	82	cell:74:2578
4 worker exact	25.496	131	0	cell:74:2578
4 worker screened	52.126	56	75	cell:74:2578

All four runs retained best objective 24.468391 and tie ID cell:74:2578. Screened runs pruned 82 candidates at 1 worker and 75 at 4 workers.

Both workloads use diagnostic samples from a frozen 1,457,546-cell proposal cache with the same exact objective. Timings were measured on a busy shared host and are not controlled latency or release-throughput measurements. The 2,048-candidate workload is an evenly spaced cache sample; the initial 255-candidate workload is cache-order sampled. Sampled best candidates do not establish full-domain correctness or localization accuracy. Source report revision 03ee598 SHA-256: a3a5d3529e45ca331efdf1336f66ecd490e7c460d73f2abff3eebabd0cd42a5a.
